

Quality, Environmental, and Energy Policy

Societal and industrial development is impossible without technical progress. Designing technology and production processes to benefit—rather than endanger—people and the environment is a central task for our society.

DODUCO Technical Solutions GmbH is committed to this ethical principle. Against this backdrop, ecological and economic responsibilities shape our activities. Quality- and environment-oriented management is an integral part of our corporate policy.

Quality- and Environment-Oriented Processes Incorporating Energy Use

Within the scope of technical and economic feasibility, our company is committed to structuring the manufacture of our products in a manner that ensures high quality and environmental compatibility through the use of suitable, innovative technologies. Energy usage is also taken into account in this context. This applies to management and support processes in addition to our core processes.

In doing so, we align our operations with recognized technical standards, the state of the art, the best available technology, and the state of safety technology. We implement appropriate solutions accordingly. We evaluate our activities and processes—both in advance and during ongoing production—for potential environmental impacts. We take all necessary measures to manufacture high-quality products while minimizing environmental impact as much as possible or, where economically justifiable, avoiding it altogether.

When undertaking construction projects, modernization, or the acquisition of new equipment, processes, or services, we take into account significant impacts on energy-related performance and energy efficiency.

Environmental Protection

Protecting the environment, conserving energy resources, and operating in a sustainable and environmentally compatible manner are among our core commitments. We are convinced that environmental protection and economic viability are compatible. This understanding forms the basis of our corporate decisions. We take the necessary precautions to prevent emissions and other environmental impacts across all operating conditions.

We are committed to providing the interested public, as well as our customers, suppliers, and service providers, with factual,

comprehensive, and confidence-building information regarding the environmental impact of our activities upon request.

Continuous Improvement Process

We are committed to a continuous optimization process for our quality, environmental, and energy management systems

aimed at improving performance in these areas. To this end, we establish measurable strategic and operational goals;

these are communicated to employees and supported by management and supervisors through the provision of appropriate

resources and necessary information.

Quality-, Environment-, and Energy-Conscious Employees

Our employees' mindset and actions are shaped by an active commitment to product quality and environmental protection.

We strive for continuous improvement in our quality, environmental, and energy awareness.

To achieve this, we continuously educate, inform, and train all employees—at every level—regarding the significance of

their work for quality, the environment, and energy usage.

Compliance with Binding Obligations and Applicable Requirements — Company Context

We are committed to fulfilling all relevant binding obligations and applicable requirements.

This term encompasses laws, regulations, and standards, as well as conditions stipulated in permits. It also includes the

requirements and expectations of all interested parties within the scope of this policy.

Supply Chain

We continuously monitor to ensure that the principles of our policy are upheld to the best possible extent by our

business partners and their own partners.
